

Product Sheet

SecurIT Professional Services

SecurIT has reached a leadership position in the field of Identity and Access Management through the realisation of many successful IAM projects. Key to this success is the focus on this domain, in depth knowledge of the solutions and a visionary, forward looking approach.

In September 1999 SecurIT realised the first Web Access Management project in Europe at KLM headquarters in The Netherlands. Since that time the company acquired tremendous skills and experience in this niche market, which requires a thorough insight in both the technical aspects related to Enterprise infrastructures and the business processes grown over time in this field.

Today SecurIT has over 60 certifications related to the IBM Tivoli Security and WebSphere portfolio and its engineers are constantly trained on the latest technologies and methods. In addition to a proven project approach, this is the best guarantee to a successful and on-time implementation of an Identity and/or Access Management Infrastructure.

SecurIT provides a portfolio of customer services:

- Project implementation in accordance with its proven methodology;
- Customer project support on an ongoing basis and subject to agreed Service Level Agreements;
- On-site insourcing for the daily operation of IAM environments.

Value-added software

In addition to its best-in-class professional services offering, SecurIT adds important components to complete the IAM picture, both for projects ran by SecurIT in the Benelux and for organizations abroad, through its network of partners.

TrustBuilder and D-Man are fully licensed software products, whereas RoleManager and SPRS are positioned as service offerings. All these components add tremendous value to the IAM platform in terms of scope, flexibility and manageability of this business-critical infrastructure.

More information on these software components can be found on www.securit.biz

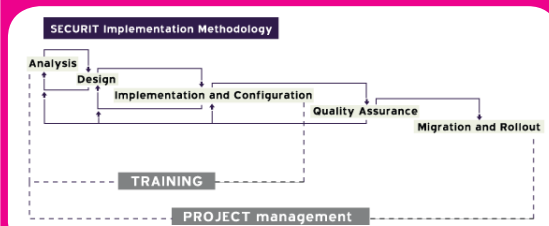

Implementation methodology

SecurIT's successful IAM implementation methodology consists of seven distinct phases that will lead to the successful and on-time implementation of the customer's project. Each phase consists of one or more tasks with detailed prerequisites, timeframes and deliverables.

The phases should be seen as autonomous parts of the project. They allow an evaluation process by the customer based on the deliverables. Such an evaluation might result in a go (proceed with next phase), no go (review project), or iteration of the phase.

The seven phases are:

1. Analysis
2. Design
3. Implementation and Configuration
4. Quality Assurance
5. Migration and Rollout
6. Training
7. Project Management

SecurIT Professional Services provide the essential added value to world leading solutions from its partner IBM and to its own software products.
