Secure Monitoring for IBM Tivoli Access Manager

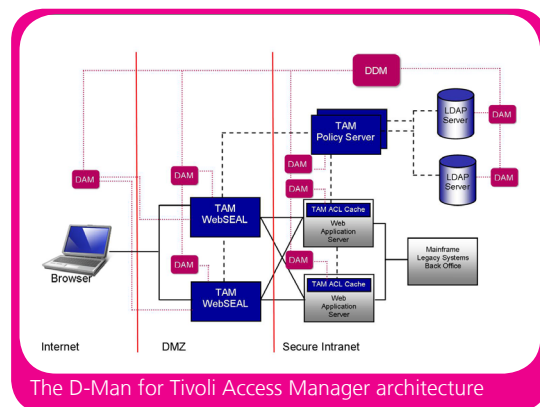

“When we have problems in our e-Business environment, ITAM always gets blamed first” Sounds familiar?

A Web Access Management platform like ITAM is a critical part of the Enterprise Infrastructure, hence the need to keep it running well around the clock. Not as easy as it sounds: many dependencies between all systems involved make it complex and components are spread over areas with different security requirements. Moreover, monitoring systems and processes from a technical perspective does not provide a guarantee for a smooth operation. You need a solution that also pays attention to the user’s perspective.

D-Man is that solution for you. It is helping IT-Administrators isolating and solving IT problems appropriately as well as end-to-end monitoring of business applications to identify service outages before they affect end-users.

About D-Man for IBM Tivoli Access Manager

With D-Man for ITAM, enterprises can concentrate on the monitoring of their ITAM systems and the applications that are secured by it, while integrating the monitoring results within their overall e-Business status reporting. D-man can also be used to monitor Federated and Cloud environments (for more information about these specific solutions, go to www.securit.biz/D-Man). The D-Man for ITAM monitoring architecture is very light-weight. In addition it provides the monitors that an enterprise needs out-of-the-box, leveraging SecurIT’s extensive experience in managing large scale ITAM environments since 10 years.

The D-Man for Tivoli Access Manager architecture

D-Man has been designed to go far beyond the basic functionality of traditional monitoring solutions. By deciding for D-Man for ITAM, enterprises take advantage of smart “pathfinders” which detect weaknesses of an ITAM system before they can cause larger damage and provoke negative end-user experiences.

And by the way: D-Man doesn’t stop at ITAM’s boundaries; it will also monitor your WebSphere Application Servers, as well as your Tivoli Identity Manager infrastructure. In short, your complete e-Business infrastructure! D-Man is JAVA based and the central management component runs on several J2EE platforms such as WebSphere Application Server.

The Benefits of D-Man for ITAM

- Look at the health of your e-Business environment from the User’s perspective
- Discover weaknesses of your ITAM system before they become real issues.
- Immediately detect the root cause in case of malfunctions
- Catch the opportunity to avoid bad end-user experiences.
- Timely capture signals like long response times, unexpected results and interrupted sessions pro-actively.
- Use D-Man stand-alone or integrated with your Enterprise Systems Management console, like Tivoli TEC.

“ITAM is a very critical component in our Web Banking infrastructure. D-Man allows us to be in control: react instantly, quickly determine the root cause of problems and prevent degradation of the environment.”
